**HAEMATOLOGY**

TEST	VALUE	UNIT	REFERENCE
FILARIAL PARASITE (CARD TEST)	NEGATIVE		

Result	Remarks
Detected	Indicates the presence of circulating Wuchereria bancrofti antigen.
Not Detected	Indicates absence of circulating Wuchereria bancrofti antigen

Note:

- Positive results are seen in parasitic disease of the human lymph system caused by Wuchereria bancrofti (W. bancrofti) leading to conditions like lymphedema, hydrocele and disfiguring disease of elephantiasis.
- Results should be correlated with clinical conditions and tests like thick smear microscopy and membrane filtration test.
- False positive results may be due to cross-reactivity with Loa loa spp or other nematode infection.
- False negative reactions may be due to the processing of samples collected early in the course of disease or low threshold of antigen. The test should be repeated on a new specimen obtained after two weeks.

Uses

- To diagnose lymphatic and non-lymphatic filariasis.
- For mapping the endemicity of lymphatic filariasis.
- For monitoring and transmission assessment surveys (TAS) of Wuchereria bancrofti.

~~~ End of report ~~~

**Mr. Sachin Sharma**  
DMLT, Lab Incharge**Dr. A. K. Asthana**  
MBBS, MD Pathologist**NOT VALID FOR MEDICO LEGAL PURPOSE**

Work timings: Monday to Sunday, 8 am to 8 pm

Please correlate clinically. Although the test results are checked thoroughly, in case of any unexpected test results which could be due to machine error or typing error or any other reason please contact the lab immediately for a free evaluation.
