**SEROLOGY & IMMUNOLOGY**

TEST	VALUE	UNIT	REFERENCE
CHIKUNGUNYA	NEGATIVE		

Positive	Indicates the presence of IgM antibodies against the Chikungunya virus.
Negative	Indicates absence of IgM antibodies against Chikungunya virus.

Note:

- Positive results in serum indicate ongoing or recent infection by Chikungunya virus causing rash, fever, and severe joint pain (arthralgia). The test cannot be used to differentiate between primary and secondary infection.
- Negative results are seen in the absence of Chikungunya virus infection. However, it does not rule out the disease.
- False positive results may be seen due to cross-reactivity with other mosquito-borne diseases like Dengue and Zika Virus infections, in patients with high levels of heterophile antibodies and Rheumatoid factor.
- False-negative results may be due to processing of samples collected early in the course of disease and immunosuppression.

Use: To diagnose an acute stage of infection caused by Chikungunya virus.

~~~ End of report ~~~

Mr. Sachin Sharma  
DMLT, Lab Incharge

Dr. A. K. Asthana  
MBBS, MD Pathologist

**NOT VALID FOR MEDICO LEGAL PURPOSE**

Work timings: Monday to Sunday, 8 am to 8 pm

Please correlate clinically. Although the test results are checked thoroughly, in case of any unexpected test results which could be due to machine error or typing error or any other reason please contact the lab immediately for a free evaluation.
